

Track Surfaces Company

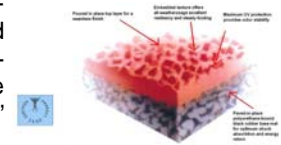

Rekortan® M99

For more than 20 years, Rekortan has been recognized as the world's premier athletic track surface. Rekortan is a poured-in place two-component polyurethane track system installed in a multi-layer application. This application process allows for a smooth and virtually seamless track system. The embedded EPDM granule top coat provides excellent all-weather performance and spike resistance. Research and development has given the Rekortan track system physical properties that enable it to be a "world class" competition and training track surface for both sprinters and distance runners alike.

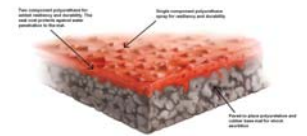

Rekortan® -S

Rekortan-S is a sandwich-style track system that offers "world class" performance for training and competition. The paved-in-place base layer provides exceptional shock absorption. The two-component polyurethane wearing layer, with an embedded or encapsulated EPDM granule top coat, provides a high energy return and excellent all-weather performance and spike resistance. The finished surface is a smooth, virtually seamless surface with the proven durability of a Rekortan track system. The Rekortan-S is "world class" track system with superior performance for any level of competition.

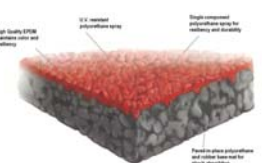

POLY-2000M

The Poly 2000M (Impermeable Mat/Spray) is a 100% polyurethane-based track system that offers exceptional all-weather performance and spike resistance. The paved-in-place base layer provides exceptional shock absorption allowing safer long-term training. The two-component polyurethane sealer layer makes this system impermeable and adds increased resilience and durability. Finally, the structural spray coat provides the highly textured and durable wearing layer. The finished track system is a smooth, virtually seamless surface with outstanding performance characteristics and durability. The Poly 2000M has become the preferred track system at the high school and small college level.

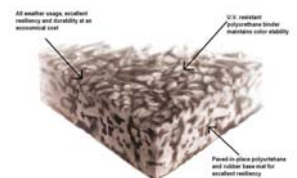

POLY-2000

The Poly 2000 (Mat/Spray) is a 100% polyurethane-based, base-mat/structural spray track system that offers exceptional all-weather performance and spike resistance. The paved-in-place base layer provides exceptional shock absorption allowing safe long-term training. The pigmented polyurethane/EPDM structural spray coat provides a highly textured and durable wearing layer. The finished track system is a smooth, virtually seamless surface with outstanding performance characteristics and durability. The Poly 2000 style track has been the number one choice for high schools installing polyurethane tracks for nearly 20 years.

POLY-1000

The Poly 1000 (Mat) is a 100% polyurethane-based track system. This system is a combination of pigmented polyurethane and SBR rubber which is paved-in-place. The finished track is a smooth, highly porous surface with excellent shock absorption. The low initial cost and the ability to upgrade to a Poly 1000, at any time in the future, makes the Poly 2000 track system a great choice for middle schools and smaller high schools looking to upgrade from latex polymer bound tracks.
